General information

wieland ricos

A field bus system introduces a high level of performance when compared to conventional wiring technology. The possibility for intelligent and convenient distribution of signals is a significant benefit of digital fieldbus technology.

Nowadays, there are a variety of functional and topological variants available on the market. This broad spectrum is due to the various requirements of the individual branches of industry as well as the interests of the manufacturer's company or international standards.

As a global company, Wieland fulfills these requirements and offers the user a universal fieldbus system with a winning design in **ricos**:

- Fieldbus couplers for all major fieldbus systems
- Openly configurable modules for digital and analog signals
- Modular assembly of fieldbus nodes
- Integrated diagnostic tools in the bus coupler enables commissioning functions such as Force, Trigger and Lock without the need for additional software
- Full range of functionality
- Spring clamp terminations for secure and rapid connection
- Economy bus coupler
- Function modules can be replaced without disconnecting the wiring
- High degree of EMC resistance due to integrated ground connection to the mounting rail
- Compact housing dimensions
- Universal marking

Remote I/O

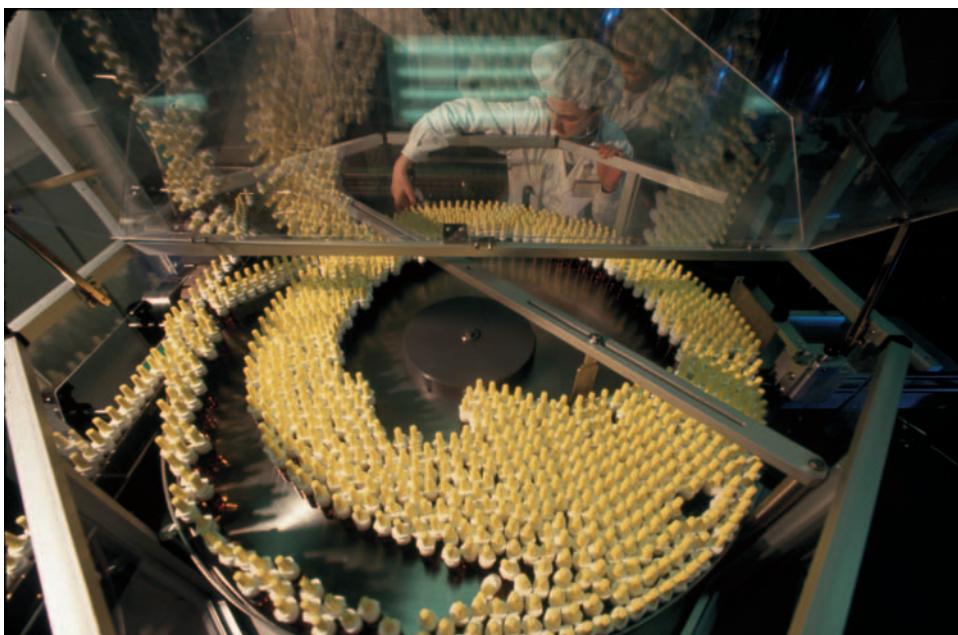

Technical information on bus systems

rics

PROFIBUS (process fieldbus) has a number of variations including PROFIBUS-DP which is established in DIN 19245, section 3 and integrated in the European fieldbus standard EN 50170, PROFIBUS has an optimum transmission rate for opening up the object-related system area as well as the sophisticated sensor/actuator area.

It is tailor-made to the requirements for fast, efficient data exchange between the programmable controllers and the distributed devices such as digital or analog input/output modules and drives

for time-critical applications, where the service development of Layer 7 is omitted. This shift of PROFIBUS-DP to the field level makes it possible to save cable. PROFIBUS-DP uses proven characteristics of the PROFIBUS transmission technology and the bus access protocol (DIN 19245, section 1 and 2) reduced to specific functions so that the high demands for system reaction time in the distributed interface systems can be met.

It is also possible to operate PROFIBUS-FMS and PROFIBUS-DP on a single cable. Particularly interesting possibilities are produced by so-called combination devices which unite the characteristics of both variations.

PROFIBUS-DP stands out due to:

- Short reaction times
- High level of interference immunity
- Replacement of the cost-effective transfer of measured values in 0(4) to 20 mA technology.

The data transmission with the distributed devices (slaves) is primarily selected at cyclic intervals as in a normal master/slave process. The central controller (master) reads the input data from the slaves and writes the output data to the slaves. PROFIBUS-DP-V1 also supports the acyclic exchange of data. PROFIBUS-DP operates with a maximum transmission rate of 12 Mbit/s and enables the transfer of 1024 bits of input/output data, distributed to 32 devices in less than 2 ms.

Properties:

- Line structure (with passive bus interface)
- Maximum length for electrical structure is 9.6 km and 90 km for optical structure
- Networking covers entire area due to division of the system into a maximum of 5 bus segments (via repeaters) up to 1.5 Mbit/s
- Number of repeaters that can be used and thus the transmission range is dependent on the baud rate
- Max. 124 devices (over all bus segments), max. 32 devices per segment
- Bus access according to token passing procedure; normal operation only with a master and polling
- High transmission rate (real-time capability for PLCs is the main reason behind DP)
- Data transmission via twin-core cable or optical fibre (active bus interface)
- Electrical structure with shielded, twisted, twin-core cable and RS 485 interface
- Bit coding in NRZ code (Non Return to Zero)
- Distributed devices and field devices can be connected and disconnected during operation
- Comprehensive diagnostics options
- Open system (DIN 19245, section 3; European standard EN 50170)

CAN

In 1983, the auto industry formulated its requirement for a bus system for use in motor vehicles. An electrical two-wire bus should replace the extensive cable harnesses for the connection of electrical systems. This was also urgently needed as the traditional cable harnesses in vehicles already exceeded 2 km in length and a mass of over 100 kg. However, requirements arose which could not be met by the bus systems that were available at that time.

These were in particular:

- High level of safety against electromagnetic interference
- Real-time capability for fast processes such as ignition and ABS
- High degree of reliability
- Economic price for applications involving mass production

In 1985, the Controller Area Network (CAN) was presented as a solution. The CAN-Bus was developed in a collaboration between Robert Bosch and INTEL Semiconductor. Meanwhile, CAN created a broad area of applications for itself in automation engineering in addition to the motor vehicle sector. Nowadays, CAN can be found in mobile systems as an internal communication system for machines or plants, in production automation, in the lower field area of process automation, in building management systems as well as many other applications.

The user organisation CiA (CAN in Automation) has been in existence since 1992 and incorporates over 200 manufacturers and users of programmable controllers, sensors, actuators, software and services [Trum95]. The CAN-Bus was standardised in the international norm ISO 11898 and thus became an open system.

The reason for the broad appeal of CAN, apart from the performance characteristics, is the availability of extremely cost-effective switching circuits, limited by the high number of items guaranteed in the auto industry.

Properties:

- Line structure (with passive bus interface)
- Number of devices only limited by capacity of driver modules
- Expansion dependent on the transmission rate: 40 m at 1 Mbit/s; 1000 m at 50 kbit/s
- Twisted pair cable with terminating resistor, optical fibre
- Object-oriented messages, broadcast and multicast with acceptance test
- Multimaster network
- Bus access via arbitration in bits according to the CSMA/CA procedure; real-time capability for messages with higher priority
- Max. transmission rate of 1 Mbit/s
- Very high level of data security (HD = 6); error detection and signalling, automatic disconnection of faulty stations (Node Guarding)
- Various chips and microcontrollers support the protocol
- Open system (ISO 11898 and CiA DS 301)

INTERBUS

The INTERBUS was specially developed by Phoenix Contact for use in machine systems and rapid processes. This fieldbus system is therefore primarily used in production automation at system level and as an object-related fieldbus for the connection of sophisticated sensors and actuators. It can be used in standard PLC applications and industrial PCs with relatively little cost and effort.

higher-level controller. The remote bus can be implemented with a maximum number of 512 stations and a maximum distance of 400 m between 2 devices. The data transmission rate is 500 kbit/s. The RS 485 standard is used for data transmission on a twisted pair cable. Each remote bus device is provided with a separate auxiliary power supply and acts simultaneously as a repeater due to its active interface. Greater distances can thereby be achieved. There is also an electrical isolation of the routing INTERBUS segment. Remote bus devices are both input/output devices and interfaces to subordinate rings. There are also compound devices, so-called I/O bus couplers.

Since the addressing of the devices is not specified in the protocol for INTERBUS, the maximum number of bus devices is determined by the master firmware. Implemented firmware permits up to 512 remote bus devices. This produces the theoretically possible distance of 102 km for an INTERBUS system if copper cables are used. A maximum system expansion of 13 km is however currently guaranteed. Greater distances can be achieved when using other transmission media. Total expansions of 100 km are currently possible when glass fibre cable is used.

Properties:

- Ring structure with active coupling of the devices
- Remote bus with max. 512 devices, max. distance of 400 m, max. total expansion of 13 km with copper cable and 100 km with glass fibre
- Local bus with max. 8 devices, max. distance of 1.5 m, max. total expansion of 10 m
- Addressing of the devices according to their sequence in the ring
- Transmission rate: remote bus with 500 kbit/s, local bus with 300 kbit/s
- Remote bus uses interface based on RS 485 two-wire connection system
- Local bus uses CMOS level and has 4 core pairs for transmission
- Protection level up to IP 65 is possible
- High level of data security, several protection mechanisms (CRC etc.)
- Open system (DIN EN 19258; European standard 50254)

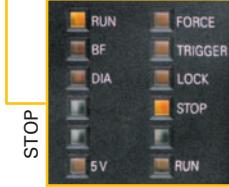

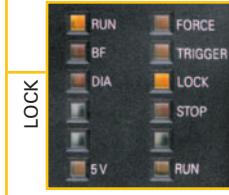

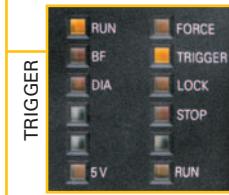

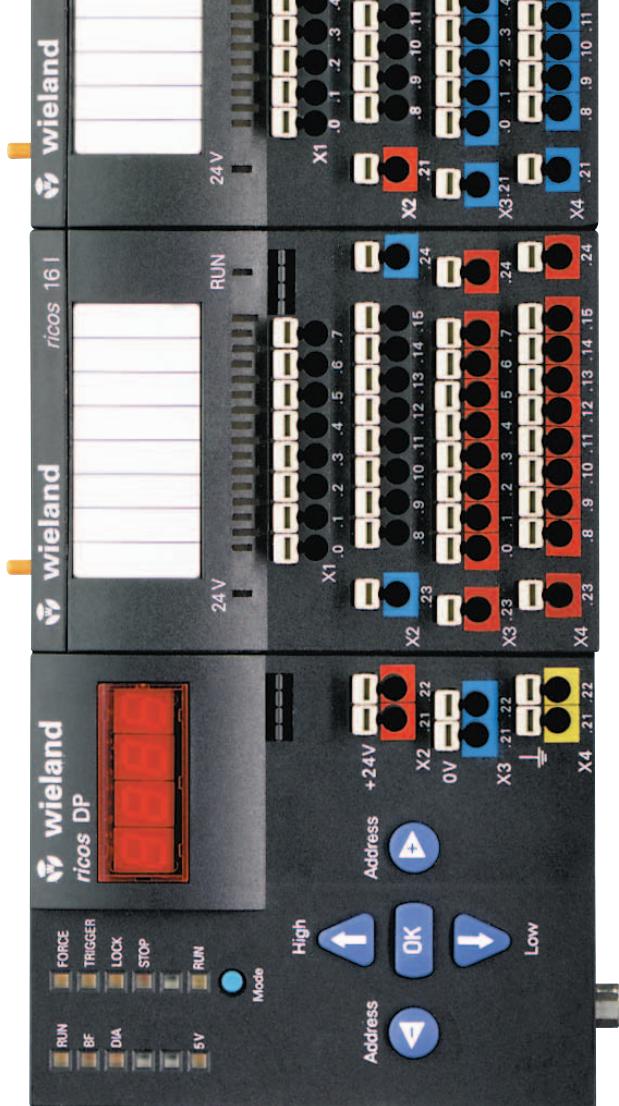

The INTERBUS has been structured using point-to-point connection as an active, coupled ring. Each bus device uses a separate outgoing and incoming cable. The return circuit required in ring systems from the last device to the first device is thereby avoided. The outgoing and return lines are fed into one cable. INTERBUS is thus similar to a line bus as regards the installation as only one cable is drawn from one device to another. A complete bus system is implemented with various bus devices. These are designated as interface modules, bus couplers, remote bus devices and local bus devices.

An interface module (master) operates as a central unit for data communication in the remote bus. The interface module also links the INTERBUS system with the

Remote I/O

Operating and display functions

Digital and analog I/O channels can be operated manually without the fieldbus (offline)
→ in FORCE mode

The last 20 process images of the nodes can be recorded and displayed.
→ in TRIGGER mode

Analog and digital I/O channels can be 'frozen' at a fixed switching state to simulate parts of the system.
→ in LOCK mode

The outputs are switched off and the inputs are no longer available.
→ in STOP mode

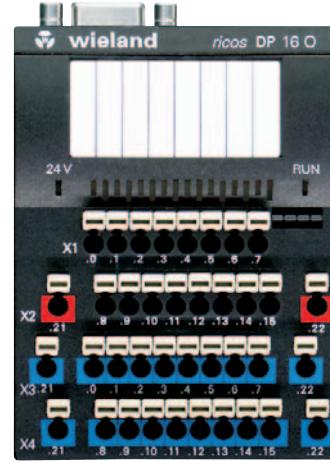

ricos

Remote I/O

Bus couplers, economy bus couplers, compact modules

wieland

Would you like to ...

- use more than one fieldbus?
- shorten your commissioning process?
- simulate signals offline – locally and without a programming device?
- set I/Os without a PLC?
- read out analogue values locally?

... then you should use the **ricos** coupler with operating and display functionality!

- Commissioning without a fieldbus interface
- Fault location on site
- Display of the signalling states of all inputs and outputs for digital and analog values

ricos bus couplers offer:

- Connection to the latest fieldbus systems such as PROFIBUS DP, Interbus, CANopen and CAN DeviceNet
- Modules for rapid DIN rail installation
- Wiring via spring-clamp terminals
- Supplied with open clamping body
- Modules are wired from the front
- Plug-in distribution board on the module
- Compact dimensions of the modules
- Up to 8 modules can be connected in series on a bus coupler, up to 128 I/O signals are therefore possible per bus node
- Electronics can be replaced without disconnecting the wiring

If you do not require the operation and display functionality of the **ricos** bus coupler ...

... then we recommend our **ricos** economy bus coupler.

ricos bus couplers and economy bus couplers are fully compatible in their functionality.

If your control requirements are more complex ...

... we can offer you our **ricos** compact modules

ricos compact modules:

- Use of 4 compact module types for digital signal detection in fieldbus systems:
 - PROFIBUS DP
 - Interbus
 - CANopen
 - DeviceNet
- All modules are slaves with bus coupler functionality
- Efficient and space-saving addition for small numbers of I/Os

ricos housing data

Material	Makrolon 2805, Lexan 161R, Polyamide 6.0 GF20
Color	black
Flammability class	according to DIN VDE 0304 T3 (IEC 707) and UL 94-V-2
Creepage resistance	according to DIN VDE 0303 T1/06.84 CTI = 600
Permanent rigidity	according to DIN VDE 0304 20,000 h/5,000 h 100/115 °C
Dielectric strength	according to DIN VDE 0303 T2 (DIN 53481/>15 kV/mm)
Protection class	Class I according to IEC 536
Degree of protection	IP20 according to EN 60529
Free fall	falling height 1 m (DIN IEC 68-2-32), in packaging
Shock resistance	according to IEC 68 part 2, see "free fall" test
Relative humidity	10...95%, no condensation
Air pressure during operation	860...1060 hPa
Wire strip length	10 mm
Clamping body opening	2.4 x 1.5 mm according to IEC 999
Mounting rail	TS35
Weight	approx. 190 g

Remote I/O PLC with Ethernet fieldbus

Freely programmable PLC with Ethernet fieldbus:

- Programming according to EN 61131-3

Fieldbus:

- Ethernet Modbus TCP/IP

ricos BC-Ethernet PLC
PLC with Ethernet Modbus TCP/IP

Approvals:  in preparation: CE

Dimensions (mm): W x H x D
74 x 92 x 51

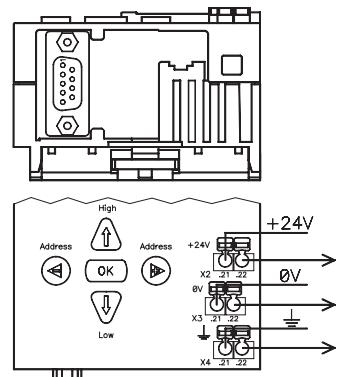

Description	Type	Part No.	Std. Pack	Other technical data
Bus coupler with diagnostic functions	BC-Ethernet PLC	83.034.0010.1	1	
Display of operating modes:				Download of operating system via Ethernet FT protocol
FORCE mode: yellow LED				Programming of CoDeSys via Ethernet TCP/IP
TRIGGER: yellow LED				Development environment
LOCK mode: yellow LED				
STOP mode: yellow LED				Extendable max. 8 ricos I/O-Module
RUN mode: green LED				all functions
System data				
Maximum number of nodes	254 per network			Program memory/ 16 MB RAM available, minus
Transmission medium	CAT 5 twisted pair 10/100 base Tx			Data memory firmware requirement, only
Maximum system expansion	100 m			limited by size of user
Baud rate	10/100 MBaud (Ethernet coupler)			memory
Internal bus refresh rate	2 ms			
Bus connection	RJ 45			Flash / Memory 1 MB for CoDeSys,
Technical data				PLC program
Maximum number of I/O bytes	64 E-Byte/64 A-Byte			Process image size,
Number of I/O modules per node	8			Program size, POU size,
Number of digital I/O points per node	128			number of variables,
Number of analogue I/O points per node	32			only limited by size of user
Address setting	Ethernet coupler			memory
Configuration	PC or PLC			
Operating voltage	24 V DC +/-20%, max. 5% residual ripple			EEPROM 512 kBytes
Power consumption	< 150 mA (< 3.5 W) (without I/O module)			Controller NetARM40
Insulation voltage	350 V AC / 50 Hz			
Creepage distances and clearances	DIN EN 61131-2; DIN EN 50178			Execution time one PLC task
Electrostatic discharge	EN 61000-4-2; 8 kV air; 4 kV contact			
Electrostatic fields	ENV 50140; 10 V/m; 30 ... 1000 MHz			Programming languages IEC 61131-3: IL, FBD, LD, SFC,
Interference immunity/emitted interference	EN 61000-6-3 / ENV 55011; limit value A; group 1			ST, CFC, AWL, FUL, KOP,
Burst	2 kV according to DIN EN 61000-4-4			C code can be incorporated,
Connection technology	Spring clamp terminal			powerful library management
Wire range: fine-stranded/solid	0.14 – 1.5 mm ² / 0.5 – 2.5 mm ²			
Ambient temperature	0 °C ... +55 °C			Times and counters typically 10 ms
Storage temperature	-25 °C ... +70 °C			
Bus-specific status displays	RUN yellow LED	RUN		Times and counters 600 µs (NETARM) for
	Data exchange green LED	TxD/RxD		1000 PLC commands
	Data exchange green LED	LINK		
	Operating voltage yellow LED	5 V		Times and counters openly programmable /
	Initialization red LED	INIT		unlimited number
Accessories				
Vertical bus connector				Function modules Builder and Editor
Vertical bus connector				
Horizontal bus connector (being prepared)				Real-time clock and date not available
